Scheduling Schemes

Shortest Job First (SJF)

The first scheduling we have implemented is the shortest first job. This policy is non-preemptive in nature. This policy schedules the process with the shortest burst time to minimize the overall waiting time for the processes. But due to the fact that it is non-preemptive, some large jobs can come first and block away the smaller jobs in the queue.

Round Robin (RR)

This is the second scheduling algorithm that we have implemented. This is a preemptive scheduling algorithm. Each of the processes is assigned a fixed amount of time slices to execute after which another process replaces it. This is a fair scheduling algorithm.

Expected Job Characteristics

Shortest Job First (SJF)

1. Low waiting time.
2. Optimal for average turnaround time.
3. Turnaround time for some processes is high, which can lead to starvation.

Round Robin (RR)

1. Low response time.
2. High throughput.
3. No starvation.
4. Equal time sharing.

Observations

Process Data 1 (SJF)

| Process | Waiting Time | Turnaround Time | Penalty Ratio |
|---------|--------------|-----------------|---------------|
| 0 | 4097 | 803 | 1.23478 |
| 1 | 4579 | 871 | 1.2349 |
| 2 | 1893 | 370 | 1.24294 |
| 3 | 1454 | 349 | 1.31584 |
| 4 | 308 | 106 | 1.52475 |
| 5 | 102 | 97 | 20.4 |
| 6 | 2631 | 1214 | 1.85674 |
| Average | 544.286 | 2152 | 4.11699 |

Average Throughput: 0.00479452

Process Data 2 (SJF)

| Process | Waiting Time | Turnaround Time | Penalty Ratio |
|---------|--------------|-----------------|---------------|
| 0 | 5 | 0 | 1 |
| 1 | 146 | 121 | 5.84 |
| 2 | 1148 | 320 | 1.38647 |
| 3 | 213 | 78 | 1.57778 |
| 4 | 2305 | 472 | 1.2575 |
| 5 | 441 | 148 | 1.50512 |
| 6 | 3878 | 597 | 1.18196 |

| | | | |
|----------------|---------|---------|---------|
| 7 | 210 | 77 | 1.57895 |

Test Processes

Shortest Job First (SJF)

A process test data that suits this scheme

```
0 100 -1
```

```
0 5 -1
```

SJF algorithm is best for these kind of processes. SJF will provide very low turnaround time and very optimal performance as the shorter job will get scheduled first.

A process test data that does not suit this scheme

```
0 300 -1
```

```
4 10 -1
```

```
5 5 -1
```

```
10 10 -1
```

In this scheme, the SJF algorithms will starve the small jobs that came after the first big job. This will lead to very high turn-around time for the small processes.

Round Robin (RR)

A process test data that suits this scheme

```
1 2 2 2 2 -1
```

```
1 2 2 2 2 -1
```

```
1 3 3 3 3 -1
```

In this scheme, the round-robin algorithms provide every job with an equal time slice, and all the jobs have time uniformly distributed so the jobs do not get stuck. Each process will finish smoothly.

A process test data that does not suit this scheme

```
1 100 -1
2 10 -1
3 13 -1
4 12 -1
5 17 -1
6 30 -1
7 50 -1
8 16 -1
9 19 -1
```

In this scheme, the Turnaround time will skyrocket if we try to optimize the responsiveness, and if we try to reduce the turnaround time, then the responsiveness will reduce.

Also, if too many processes arrive, the cost of context switching might significantly impact the system's performance.

Analysis

Shortest Job First (SJF)

We can see the when we run SJF in the given test cases, the waiting time for the processes is quite low as the scheduler tried to schedule the shortest job first. Due to it being non-preemptive, it schedules some high burst job first, making the turnaround time of other processes higher.

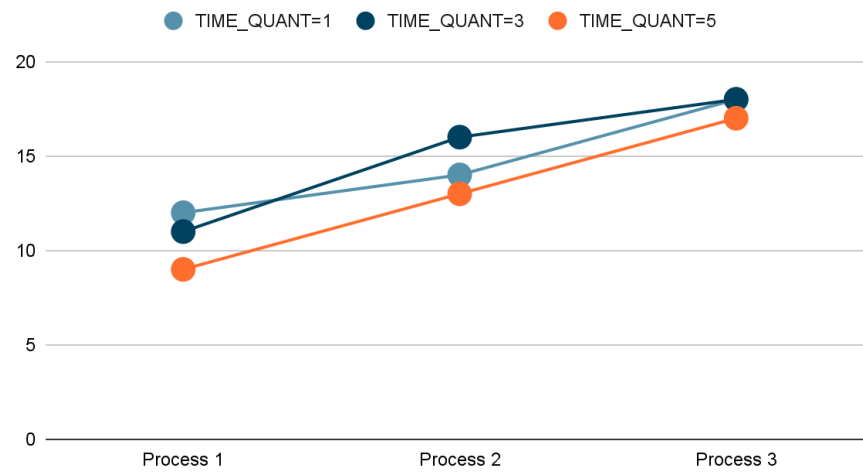

Round Robin (RR)

We can see that when we run the RR on the given test cases, it reduces the turn around time for process by a big margin when compared to SJF. Since this scheduling algorithm is preemptive in nature, it lead to higher penalty ratio as some processes get preempted in middle of their bust and get replaced by another process. If we assume the code of context switch to be very high, this policy will give very low system throughput for small quantum (or time slice). But here the quantum was optimum, which lead to high system throughput.

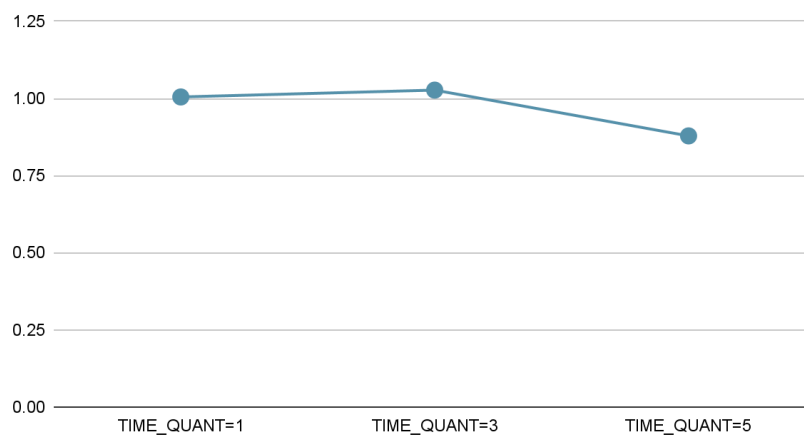

A process test data that suits this scheme

```
1 2 2 2 2 -1
1 2 2 2 2 -1
1 3 3 3 3 -1
```

Turnaround Time

Average Penalty

The graphs exhibit a penalty of less than 1 and a turnaround time of less than 20.

A process test data that does not suit this scheme

```

1 100 -1
2 10 -1
3 13 -1
4 12 -1
5 17 -1
6 30 -1
7 50 -1

```

8 16 -1
9 19 -1

Average Turnaround time

Average Penalty

The graphs show high penalties and high turnaround times.
